

AI Malware Investigation Report

Report ID: d42be975-ace4-4764-ad63-c991d89e90f7

Executive Summary

The analyzed file, 'fdm_x64_setup.exe', has been assessed as Benign by the ML model with a very low malware probability of 3.49% and a Risk Score of 3/100. This indicates a SAFE / LOW RISK classification. The static PE analysis suggests the file is likely legitimate software. No malicious behaviors or indicators were identified during the automated scan.

Detection Summary

The primary detection engine, the ML model, classified the file as 'Benign' with a 'Low' risk level and a high confidence of 97%. No YARA rule matches, CAPA behavioral indicators, or Malice AV hits were provided in the scan results, therefore these aspects are considered Not Observed.

Final Verdict & Classification

Verdict: SAFE / LOW RISK - This verdict is based on the ML model's explicit classification of 'Benign' and a very low Risk Score of 3 out of 100, which falls well within the 'SAFE / LOW RISK' threshold.

Classification: Benign - The ML model explicitly classified the file as 'Benign' with a 'Malware Family' also reported as 'Benign'.

Confidence Assessment: High. The ML model reported a 97% confidence in its 'Benign' verdict, further supported by a minimal malware probability and a 'Low' risk level. The absence of any conflicting indicators reinforces this assessment.

Technical Findings

Not Observed - Detailed static PE analysis findings such as specific imports, section characteristics, or entropy values were not provided in the scan results. The ML model's assessment was based on static PE features, leading to a benign classification.

Behavioral Analysis

Not Observed - No dynamic analysis or CAPA behavioral indicators were provided in the scan results. Based on the static ML analysis, no malicious behaviors are inferred or confirmed.

Supporting Evidence

['ML Verdict: Benign', 'Malware Probability: 3.49%', 'Risk Level: Low', 'Risk Score: 3/100', 'Confidence: 97%', 'Recommendation: The file is likely benign based on static PE features. If the source is trusted, it can be treated as low risk.']

- fdm_x64_setup.exe (Filename)

MITRE ATT&CK Mapping

Risk Assessment

Overall, the file 'fdm_x64_setup.exe' is assessed as LOW RISK. This assessment is directly derived from the ML model's 'Benign' verdict, a very low malware probability (3.49%), and a minimal Risk Score of 3/100. The high confidence level (97%) in the ML prediction further supports this low-risk categorization. No evidence of malicious intent or capabilities was identified.

Potential Impact

Given the 'Benign' classification and 'Low Risk' assessment, the potential impact of executing this file is considered negligible. There is no observed indication of malicious activity that would lead to system compromise, data loss, or operational disruption.

Recommended Actions

- Verify the file's source and digital signature to ensure its authenticity, especially if it was downloaded from an untrusted location.
- If the source is trusted, the file can be executed with a high degree of confidence.
- Monitor system behavior post-execution for any unexpected activities, although none are anticipated based on current analysis.

Conclusion

Based on the comprehensive analysis of the provided scan results, the file 'fdm_x64_setup.exe' is confidently assessed as Benign and poses a SAFE / LOW RISK to the environment. The ML model's high confidence and low risk score strongly support this conclusion. Further investigation is not warranted unless additional suspicious context or behavioral anomalies are observed.
